

## Is car wax needed

Most new cars in the past few years come with a transparent protective top coat layer of paint called the clear coat. Does that mean you do not need car wax anymore? Environmental factors such as sunlight, road debris, and rain will eat away at the finish of your car so car wax can still be used to improve the shine on your car. Adding a coat of wax after washing your car can help to protect the paint on your car.

There are different kinds of car waxes. These include liquid, paste, and the spray on, wipe off types. The hardest to apply is liquid car wax and this is also the hardest car wax to buff out after applying. Paste car wax used to be the most common type of car wax used but is now the least commonly used car wax. Paste [car wax](#) is easy to spread on a car because it comes with a reusable applicator that helps keep the car wax off glass. The newest kind of car wax is the spray on, wipe off car wax. This kind of car wax can be applied to a car that is still wet from washing but the shine does not last very long.

What kind of car wax should you use on your car? It depends on the size and age of your car, how much work you are willing to do, and how much time you are willing to put into waxing your car. If your car is only one or two years old, the finish should still be good and you will only need a light spray wax to make it shine. For an older car with a dull finish, using a liquid car wax will clean as well as shine the paint on your car. To save time, using a spray on, wipe off car wax is the way to go. Quick touch ups in between waxings can also be done with a spray on, wipe off car wax.

You should clean your car thoroughly before applying car wax. Do not use car wax on your car when it is in the sun or if the paint is hot because it will cause the wax to scratch the paint. If your car is hot or in the sun, do not apply car wax until it has cooled because the car wax will scratch the hot paint on your car. Apply car wax in small sections so you easily buff the area without the car wax staying on too long and drying out.
