

Wax On with Car Wax

Does your paint job look duller than it should? Perhaps you just purchased a new car and would like to protect the exterior paint. If either of these statements ring true, you are probably in the market for some car wax.

There are a few things to know about car wax before you make your purchase and get going. There are many good brands of wax to choose from, but your best bet is buying a kind that contains carnauba wax. Carnauba wax is better at keeping out moisture and it is easier to buff than typical car wax, and therefore it is a bit more costly.

It is best to bypass granular or abrasive waxes unless you are a professional. These kinds of waxes can scratch your paint job if used on the wrong colors and finishes. When in doubt, always go with smooth.

A good car wax typically shows stiffness and is difficult to wax on and off the car. If you are getting a good arm work out, it is typically a sign that the car wax is high quality! The softer waxes usually don't protect paint as well since they come off easier.

Car wax comes in a few different forms, those which you rub on from a tub, and others which you spray on. If you have arthritis or generally sensitive hands, spray on car wax may be right for you. However, since these kind of waxes are softer, you will have to apply more often for maximum effect. Car waxes which come in round tubs are harder to apply and remove, but you do not have to apply them as often and the paint protection is typically better.

Since you know which [car wax](#) to pick for your needs, we can get to the waxing process. First, you will need to wash your car well, making sure that you dry it completely afterward. Be sure to park your car in a shady and cool spot next. You should pick a relatively cool day, because the wax will dry too quickly for removal, otherwise.

A damp sponge, and a soft terry cloth rag are all you will need for waxing. Dip your dampened sponge into the wax, keeping a dollop the size of a half dollar coin on there.

Beginning on one side of the car, rub on the car wax with small circular motions. Work your way around the entire outside of the car using these circular motions, reapply wax to your sponge when necessary. Take care to avoid the cracks between the hood, doors and trunk. If you get some wax in these seams, you can use a soft bristle toothbrush to gently remove it.

Once you have worked your way completely around the car, the wax will be dry where you started and you can begin removing it. Remove wax with the terry cloth towel from where you began, using the same motions. Be sure to look for any missed spots once you are finished. It is important to make sure all of the wax is off in a couple of hours max, because it can damage your paint job if left on. Similar Entries [Car wash](#) . [Ultimate car wash](#) .
