

## A Few Things You May Not Know About Steel Buildings

Steel buildings take on many different personalities. When we hear the words "steel buildings," we typically think of the iconic World War II era Quonset huts or the one story steel machine and auto shop buildings that are popular with small business owners. Not so fast! If you look closely, you'll discover that steel buildings are everywhere.

Steel buildings are made from the most recycled material on earth, making them second to none in sustainability. Steel buildings also cost less to heat during the winter months and cool during the summer months, which factor alone renders steel buildings an attractive choice for housing and storage. These structures possess the strength to resist fire, hurricanes, tornadoes and earthquakes, which pleases insurance agents immensely. Low utility bills, maintenance costs and insurance premiums, what's not to like?

Steel buildings are the structures of choice for growing businesses wishing to expand their office space. For one thing, steel office buildings can be designed and erected in less time and for less money than a standard concrete building. Free of interior support columns, steel buildings also allow for more flexibility in floor plan configurations. These structures easily fit customized design needs. Their durability also makes them a wise long term business investment.

How about horse riding arenas? Fire and weather resistant steel buildings are an excellent choice for housing horses and riding and training pens. And, since steel buildings expand to almost any length, they are adaptable to any size equine operation. Livestock farmers turn to steel buildings for many of the same reasons. Entire dairy farm operations are easily housed and protected within an expanded size steel building.

There's one more agriculture use to which steel buildings are well suited: housing crop duster airplanes. Their durability and expandability work extremely well when it comes to protecting the substantial financial investment represented by a single small airplane. A steel airplane hangar building will easily accommodate an airplane and the room needed for related servicing and repair equipment. Steel buildings are well suited for more than one agricultural use!

You may be surprised to learn that church congregations use steel buildings for houses of worship. Perhaps it's not so surprising after all, if you consider that the same qualities of steel buildings that appeal to companies and agricultural businesses also appeal to church groups. Easy assembly, low maintenance and utility costs, and fire and weather resistance (which themselves equal lower insurance costs) all contribute to savings in time and money for a budget conscious congregation.
